The American Cancer Society Cancer Action Network (ACS CAN), the nonprofit, nonpartisan advocacy affiliate of the American Cancer Society, supports evidence-based policy and legislative solutions designed to eliminate cancer as a major health problem. ACS CAN works to encourage elected officials and candidates to make cancer a top national priority. ACS CAN gives ordinary people extraordinary power to fight cancer with the training and tools they need to make their voices heard. For more information, visit www.acscan.org.
Executive Summary

Each year, tobacco use causes hundreds of thousands of premature deaths and costs billions of dollars in medical care and productivity losses in the United States. Strong tobacco control policies at the state level can help reduce the burden of tobacco use. Saving Lives, Saving Money: A State-by-State Report on the Health and Economic Benefits of Tobacco Taxes, provides new information about the public health and economic benefits to states that increase their cigarette taxes.

Increasing cigarette excise taxes is an evidence-based policy approach to accomplishing the critical public health goals of reducing the number of current and potential smokers. Cigarette taxes are also a powerful economic tool, directly producing sustained increases in state tax revenues and resulting in large savings in health care costs.

The American Cancer Society Cancer Action Network (ACS CAN) commissioned leading experts to derive updated and expanded estimates for the public health benefits and economic savings of a $1-per-pack increase in the cigarette excise tax in each of the 50 states and the District of Columbia.

These estimates show a $1-per-pack cigarette tax increase in every state and D.C. would result in fewer smokers, smoking-related deaths, and youth who become smokers. In addition, raising cigarette taxes would substantially increase tax revenues and reduce health care costs associated with several smoking-related diseases.

**SAVING LIVES**

A $1-per-pack cigarette tax increase would reduce the number of smokers by the thousands in every state. In a large state like California, the tobacco tax increase would result in 130,000 fewer adult smokers. In seven specific states the tobacco tax increase would prevent more than 20,000 premature deaths. All told, a $1 increase in the cigarette taxes of every state would produce the following public health benefits:

<table>
<thead>
<tr>
<th>Adults Who Would Quit Smoking</th>
<th>Youth Who Would Never Start Smoking</th>
<th>Reduction in Smoking-Related Deaths</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.40M</td>
<td>1.69M</td>
<td>1.32M</td>
</tr>
</tbody>
</table>

**SAVING MONEY**

A $1-per-pack tobacco tax increase would lead to more than $100 million in revenues in each of 44 of the states. At the same time, tobacco tax increases would save states hundreds of millions of dollars in health care costs. If every state and D.C. raised its cigarette tax by $1 per pack, they would save nearly $645 million over five years by reducing lung cancer, heart attack, and stroke treatment costs. All states and D.C. would also see significant savings in Medicaid programs treating smoking-related conditions, as well as reduced pregnancy-related treatment costs.

</tbody>
</table>

**WHAT STATES CAN DO**

ACS CAN recommends that all states aim for regular, significant cigarette tax increases to achieve the maximum public health and economic benefits.

- Every state should raise its cigarette tax as part of a broader ongoing effort to reduce tobacco use and improve public health.
- Tax increases should be significant to have a significant effect on curbing tobacco use.
- Tax increases should be frequent.
- States should reduce illegal sales of cigarettes.
- Tax revenue should be directed toward public health goals such as tobacco prevention and cessation programs.

1 Reduction in smoker deaths and averted future smoker deaths
Introduction

Tobacco’s burden on public health and the economy in the United States is well known. There are hundreds of thousands of premature deaths, hundreds of billions of dollars in medical care and productivity losses each year, and more than 1,000 people start smoking every day.

Implementing strong tobacco control policies at the state level has been proven to reduce smoking and discourage new smokers. Through a three-pronged approach – higher tobacco taxes, comprehensive smoke-free laws, and fully funded tobacco prevention and cessation programs – experience and evidence show that state tobacco control policies can help curb the tobacco burden on this country.

Cigarette excise taxes are also a powerful economic tool. Higher cigarette taxes produce sustained increases in tax revenues, as has been demonstrated in dozens of states.\(^2\)

Cigarette tax increases are a widely used, evidence-based policy approach to reduce the number of current smokers and discourage potential smokers. The taxes also produce sustained increases in state tax revenues, demonstrated through dozens of state cigarette tax increases.

The taxes vary widely from state to state. As of June 1, 2011, cigarette taxes ranged from a high of $4.35 per pack in New York to a low of 17 cents per pack in Missouri. No state comes close to matching the health and economic costs attributed to smoking, which are estimated at $10.28 per pack. Although many states have raised their cigarette taxes over the past five years, 21 states still have taxes that are less than $1 per pack. Fourteen states and D.C. have cigarette taxes of $2 a pack or more, but would still see significant public health benefits from further increases.

To better understand the dramatically positive impact of tobacco tax increases, researchers have created models to measure the health and economic benefits to a state when a tax increase is implemented. Measuring the benefits of these increases can be complex, but the results are a critical tool for demonstrating just how many deaths can be prevented and how much money can be saved – and raised – as a result.

ABOUT THIS REPORT

This report provides new information about the public health and economic benefits to states that increase their tobacco excise taxes. The first part of the report describes the projected trends across all states and D.C. and an overall picture of the dramatic impact if they all increased their tobacco excise taxes by $1 per pack. The analysis projects the benefits of cigarette tax increases on public health, such as reduction in smoking and deaths avoided, and on state budgets, including increases to state revenues reduced spending on treatment for lung cancer and other diseases, caring for pregnant smokers, and savings to state Medicaid programs. The second half of the report includes a breakdown of the health and economic benefits that a cigarette tax increase would bring to each state.

The estimates in this report were calculated for ACS CAN using the most up-to-date economic and public health research and methodology. In estimating the changes to the overall health of the population, the findings are based on standard assumptions about how tobacco users react to changes in tobacco prices and laws around tobacco use, how these policies reduce the number of youth who become regular smokers, and the most recent health data from the Centers for Disease Control and Prevention (CDC) on the percentage of smokers expected to die prematurely from smoking. Similarly, in estimating the cost savings to states from tobacco control policies, the report used the latest studies and data on the costs of smoking-related disease and the estimates of savings to states with lower burden of treating lung cancers, heart attacks, and strokes caused by smoking. The methodology and assumptions used to calculate the estimates are detailed in the Methodology.

These estimates will change slightly each year because the data are based on current tobacco control policies, population data, local laws, and health care costs that can change over time. These estimates take into account past changes in the federal tobacco tax.

Saving Lives

Taxes on cigarettes and other tobacco products improve public health in several ways. Higher taxes make cigarettes more expensive. To avoid the higher costs, some smokers reduce the number of cigarettes they smoke and some quit smoking. For every 10 percent increase in the price of a pack of cigarettes, youth smoking rates drop by 6.5 percent and overall cigarette consumption declines by 4 percent. More expensive cigarettes mean that young people will be less likely to become regular smokers. The fewer current smokers and the fewer youth who start smoking, the fewer people who would be expected to die from a tobacco-related disease. The effects occur gradually after the tax is applied, as smoking is reduced, disease slows, and ultimately, death rates decline.

In total, if each state and D.C. increased its cigarette tax by $1, the following estimates of public health benefits would apply across the United States:

2. Reduction in smoker deaths and averted future smoker deaths.
The best way to reduce the health harms from smoking is to keep people, especially the young, from ever picking up a cigarette in the first place. The majority of new smokers are under 18 when they start. Research also shows that youth are even more sensitive to the prices of tobacco products than adults. That means increasing the tax which results in higher priced cigarettes is an effective way to reduce the number of kids who try cigarettes, become regular smokers, and eventually succumb to disease or death resulting from their tobacco use.

In each state that raised its cigarette tax by $1 a pack, at least 1,000 fewer people, many of them youth, would become regular smokers. Thirty states would reduce the number of future smokers by more than 20,000; 12 states would prevent more than 50,000 people from becoming smokers. In Texas alone, this tax increase could result in 150,000 fewer people starting to smoke.

About half of all smokers will eventually die of a tobacco-related illness. By preventing smokers from ever starting, tobacco taxes prevent thousands of premature deaths. A $1 tax increase in California, for example, would result in 76,700 fewer premature deaths due to a lower initiation rate. More than half of states would avoid at least 10,000 premature deaths by reducing the number of future smokers.

Across the United States, we would see 1.6 million fewer future smokers and 845,000 fewer premature deaths of future smokers if every state and D.C. raised its cigarette tax by $1.00.

A total of 480,000 premature deaths of current adult smokers could be prevented nationwide if every state and D.C. implemented a $1-per-pack cigarette tax increase.

### REDUCTIONS IN FUTURE SMOKERS AND FUTURE SMOKER DEATHS

The best way to reduce the health harms from smoking is to keep people, especially the young, from ever picking up a cigarette in the first place. The majority of new smokers are under 18 when they start. Research also shows that youth are even more sensitive to the prices of tobacco products than adults. That means increasing the tax which results in higher priced cigarettes is an effective way to reduce the number of kids who try cigarettes, become regular smokers, and eventually succumb to disease or death resulting from their tobacco use.

In each state that raised its cigarette tax by $1 a pack, at least 1,000 fewer people, many of them youth, would become regular smokers. Thirty states would reduce the number of future smokers by more than 20,000; 12 states would prevent more than 50,000 people from becoming smokers. In Texas alone, this tax increase could result in 150,000 fewer people starting to smoke.

About half of all smokers will eventually die of a tobacco-related illness. By preventing smokers from ever starting, tobacco taxes prevent thousands of premature deaths. A $1 tax increase in California, for example, would result in 76,700 fewer premature deaths due to a lower initiation rate. More than half of states would avoid at least 10,000 premature deaths by reducing the number of future smokers.

Across the United States, we would see 1.6 million fewer future smokers and 845,000 fewer premature deaths of future smokers if every state and D.C. raised its cigarette tax by $1.00.

Increasing Public Health Benefits

All of the public health benefits described are directly related to the size of the tax increase. The larger the tax increase, the greater the benefits. A $1.25 tobacco tax increase in a state like Mississippi would yield significantly greater benefits than a $1 increase by preventing an additional 5,600 people from becoming smokers, reducing the number of adult smokers by an additional 4,600 and averting about 4,400 premature deaths due to smoking.

Conversely, when states implement lower cigarette tax increases, the potential public health benefits are smaller, fewer deaths are prevented, and smoking rates decline more slowly.

Saving Money

Raising cigarette taxes produces fiscal benefits in two ways. First, higher taxes bring in more tax revenue for the state. This is true even as the overall sales of cigarettes decline – the additional tax revenue is greater than the lost revenue from fewer cigarettes sold. Second, because higher tobacco taxes are proven to reduce smoking rates and consumption, states spend significantly less on treating people for tobacco-related disease and recognize major savings in programs such as Medicaid.

A $1-per-pack cigarette tax increase in every state would yield the following health care cost savings across the country over five years:

<table>
<thead>
<tr>
<th>Lung Cancer Treatment Savings</th>
<th>Heart Attack and Stroke Treatment Savings</th>
<th>States’ Medicaid Program Savings</th>
<th>Smoking-Related Pregnancy Treatment Savings</th>
<th>Increase in State Revenue</th>
</tr>
</thead>
<tbody>
<tr>
<td>$199.20M</td>
<td>$443.73M</td>
<td>$146.34M</td>
<td>$406.69M</td>
<td>$8.62B</td>
</tr>
</tbody>
</table>

Increased Revenue

By increasing its cigarette tax, each state would see an overall increase in cigarette tax revenues. The higher the tax increase, the greater the increase in revenue. A $1-per-pack tax increase would lead to at least $100 million in additional revenues in each of 44 of the states. The District of Columbia, which would see the smallest revenue due to its small population, would receive an estimated $6.7 million additional tax revenue each year from a $1 tobacco tax increase. For a large state like Texas, a $1.00 tobacco tax increase would lead to a spike of $532 million over current revenues. If every state across the country and D.C. implemented a $1-per-pack tax increase, the additional revenue raised would total $8.62 billion, bringing the total revenue to $25.7 billion. This represents a 54 percent increase over 2010 gross state cigarette tax revenue.9

If every state across the country and D.C. implemented a $1-per-pack tax increase, the additional revenue raised would total $8.62 billion, bringing the total revenue to $25.7 billion. This represents a 54 percent increase over 2010 gross state cigarette tax revenue.

**DECREASED HEALTH CARE COSTS**

Reducing smoking saves states millions of dollars in expenditures for treating lung cancer, heart attacks and strokes, pregnancy complications, and other health problems. With a $1-per-pack tax increase, 38 states would each save at least $1 million in health care costs over five years from treating lung cancer alone. Fourteen states would enjoy at least a $5 million in savings each, and California would save an estimated $18.5 million due to lower lung cancer treatment costs. If every state raised its cigarette tax by $1, they would save close to $200 million over five years by reducing lung cancer treatment costs.

The health care savings from reducing costs for treating heart attacks and strokes related to smoking would be even greater. Seventeen states would save more than $10 million over five years, with four states saving in excess of $20 million just for treating these conditions.

States would also benefit from lower costs for treating smoking-related pregnancy complications. More than half of the states would each save at least $5 million over five years with a $1 tax increase. Every state except for three and D.C. would save at least $1 million over that time.

State Medicaid programs spend large sums on treating tobacco-related disease. Seven states would each save an estimated $5 million or more over five years by increasing their tobacco tax by $1. Twenty-nine states would each see at least $1 million in savings over five years.

If every state and D.C. raised its cigarette tax by $1, they would save close to $200 million over five years by reducing lung cancer treatment costs.

Policy Recommendations

As these estimates show, states derive large, measurable benefits from increasing cigarette taxes. Over the past 10 years, 47 states and D.C. have raised their cigarette taxes in more than 100 separate increases. The average state cigarette excise tax has increased by a factor of five since the mid-1990s.10 Fourteen states and D.C. now have cigarette taxes of $2 or more, but in 21 states tobacco taxes remain less than $1.

Cigarette taxes are proven, predictable sources of new state revenue. Yet some states are considering rolling back cigarette taxes, which would harm public health, reduce their tax revenue, and increase their health care costs. ACS CAN recommends that all states aim for regular, significant cigarette tax increases to achieve the maximum public health and economic benefits.

- Every state should raise its cigarette tax.

There is no ceiling to the health and economic benefits of increasing cigarette taxes. All states would see great return from higher tobacco taxes, but those states with currently low cigarette taxes would particularly benefit from this policy change.

- Tax increases should be significant.

Small tax increases are not effective in producing significant public health and economic gains. The increase should be both substantial in absolute amount (at least $1 per pack), and also large enough compared to the existing tax and average price to cause consumers to notice the price difference and respond to it.

- Tax increases should be frequent.

As with most consumer goods, the impact of a price increase on consumer behavior declines over time. The tobacco industry continually devises new ways to maintain sales despite tax increases and other tobacco control policies through price discounting, new marketing techniques, and other activities. To maintain the impact of the tax on smoking rates, public health, revenues, and health care costs, states should raise cigarette taxes on a frequent basis.

- States should reduce illegal sales of cigarettes.

Illegal cigarette sales lessen the impact of cigarette excise taxes. To avoid this, states should adopt high-tech tax stamps, license all involved in tobacco distribution, and effectively enforce tax policies.

- Tax revenue should be directed toward public health goals.

Research has shown that states can see even greater payback and public health gains from cigarette tax increases if the tax revenues are reinvested in comprehensive programs designed to reduce tobacco use and to prevent non-communicable diseases.11 This could include tobacco cessation programs and evidence-based health and wellness strategies.

The Health and Economic Benefits of Raising Alabama’s Cigarette Tax

A $1.00 increase in Alabama’s cigarette tax would prevent approximately 34,400 youth from smoking and, over five years, save an estimated $14.72 million in lung cancer, heart attack, and stroke costs.

Raising the excise tax on cigarettes is one of the most effective ways to reduce smoking, save lives, and raise government revenue – even in tough economic times. Excise taxes decrease the number of youth who start smoking, increase the number of smokers who quit, cut health care costs, and reduce deaths from lung and other cancers, heart attacks, strokes, and other preventable diseases. The health benefits of cigarette taxes are even greater when the revenue raised is earmarked for tobacco control or public health programs.

Alabama’s current cigarette tax is $0.425 per pack, the 5th lowest in the nation. This is well below the nationwide average of $1.45 per pack. Alabama has not raised its cigarette tax since 2004.*

SAVING LIVES

A $1.00-per-pack increase in Alabama’s cigarette tax would be expected to provide the following reductions in the number of smokers and, as a result, the number of smoking-related deaths:*

<table>
<thead>
<tr>
<th>Adults Who Would Quit Smoking</th>
<th>Youth Who Would Never Start Smoking</th>
<th>Reduction in Smoking-Related Deaths</th>
</tr>
</thead>
<tbody>
<tr>
<td>29,800</td>
<td>34,400</td>
<td>27,400</td>
</tr>
</tbody>
</table>

SAVING MONEY

In addition to saving lives, raising Alabama’s cigarette tax would cut healthcare costs and raise millions of dollars in revenue. Over time, a $1.00 cigarette tax increase would be expected to produce the following economic and fiscal benefits:*

<table>
<thead>
<tr>
<th>Over Five Years</th>
<th>Over One Year</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lung Cancer Treatment Savings</td>
<td>Heart Attack and Stroke Treatment Savings</td>
</tr>
<tr>
<td>$4.22M</td>
<td>$10.50M</td>
</tr>
</tbody>
</table>

*Estimates are based on analysis performed on behalf of the American Cancer Society Cancer Action Network. Totals in charts have been rounded.
The Health and Economic Benefits of Raising Alaska’s Cigarette Tax

A $1.00 increase in Alaska’s cigarette tax would prevent approximately 3,700 youth from smoking and, over five years, save an estimated $1.19 million in lung cancer, heart attack, and stroke costs.

Raising the excise tax on cigarettes is one of the most effective ways to reduce smoking, save lives, and raise government revenue – even in tough economic times. Excise taxes decrease the number of youth who start smoking, increase the number of smokers who quit, cut health care costs, and reduce deaths from lung and other cancers, heart attacks, strokes, and other preventable diseases. The health benefits of cigarette taxes are even greater when the revenue raised is earmarked for tobacco control or public health programs.

Alaska’s current cigarette tax is $2.00 per pack, the 11th highest in the nation. This is well above the nationwide average of $1.45 per pack. Alaska has not raised its cigarette tax since 2007.

SAVING LIVES
A $1.00-per-pack increase in Alaska’s cigarette tax would be expected to provide the following reductions in the number of smokers and, as a result, the number of smoking-related deaths:

The Health and Economic Benefits of Raising Illinois’ Cigarette Tax

A $1.00 increase in Illinois’ cigarette tax would prevent approximately 77,900 youth from smoking and, over five years, save an estimated $25.94 million in lung cancer, heart attack, and stroke costs.

Raising the excise tax on cigarettes is one of the most effective ways to reduce smoking, save lives, and raise government revenue – even in tough economic times. Excise taxes decrease the number of youth who start smoking, increase the number of smokers who quit, cut health care costs, and reduce deaths from lung and other cancers, heart attacks, strokes, and other preventable diseases. The health benefits of cigarette taxes are even greater when the revenue raised is earmarked for tobacco control or public health programs.

Illinois’ current cigarette tax is $0.98 per pack, the 20th lowest in the nation. This is well below the nationwide average of $1.45 per pack. Illinois has not raised its cigarette tax since 2002.*

SAVING LIVES

A $1.00-per-pack increase in Illinois’ cigarette tax would be expected to provide the following reductions in the number of smokers and, as a result, the number of smoking-related deaths:*  

<table>
<thead>
<tr>
<th>Adults Who Would Quit Smoking</th>
<th>Youth Who Would Never Start Smoking</th>
<th>Reduction in Smoking-Related Deaths</th>
</tr>
</thead>
<tbody>
<tr>
<td>59,500</td>
<td>77,900</td>
<td>59,400</td>
</tr>
</tbody>
</table>

SAVING MONEY

In addition to saving lives, raising Illinois’ cigarette tax would cut healthcare costs and raise millions of dollars in revenue. Over time, a $1.00 cigarette tax increase would be expected to produce the following economic and fiscal benefits:*  

<table>
<thead>
<tr>
<th>Over Five Years</th>
<th>Over One Year</th>

The Health and Economic Benefits of Raising Indiana’s Cigarette Tax

A $1.00 increase in Indiana’s cigarette tax would prevent approximately 55,100 youth from smoking and, over five years, save an estimated $17.89 million in lung cancer, heart attack, and stroke costs.

Raising the excise tax on cigarettes is one of the most effective ways to reduce smoking, save lives, and raise government revenue – even in tough economic times. Excise taxes decrease the number of youth who start smoking, increase the number of smokers who quit, cut health care costs, and reduce deaths from lung and other cancers, heart attacks, strokes, and other preventable diseases. The health benefits of cigarette taxes are even greater when the revenue raised is earmarked for tobacco control or public health programs.

Indiana’s current cigarette tax is $0.995 per pack, the 21st lowest in the nation. This is well below the nationwide average of $1.45 per pack. Indiana has not raised its cigarette tax since 2007.

SAVING LIVES
A $1.00-per-pack increase in Indiana’s cigarette tax would be expected to provide the following reductions in the number of smokers and, as a result, the number of smoking-related deaths:

**The Health and Economic Benefits of Raising Nebraska’s Cigarette Tax**

A **$1.00 increase in Nebraska’s cigarette tax would prevent approximately 11,000 youth from smoking and, over five years, save an estimated $3.62 million in lung cancer, heart attack, and stroke costs.**

Raising the excise tax on cigarettes is one of the most effective ways to reduce smoking, save lives, and raise government revenue – even in tough economic times. Excise taxes decrease the number of youth who start smoking, increase the number of smokers who quit, cut health care costs, and reduce deaths from lung and other cancers, heart attacks, strokes, and other preventable diseases. The health benefits of cigarette taxes are even greater when the revenue raised is earmarked for tobacco control or public health programs.

Nebraska’s current cigarette tax is $0.64 per pack, the 14th lowest in the nation. This is well below the nationwide average of $1.45 per pack. Nebraska has not raised its cigarette tax since 2002.+

**SAVING LIVES**

A $1.00-per-pack increase in Nebraska’s cigarette tax would be expected to provide the following reductions in the number of smokers and, as a result, the number of smoking-related deaths:*  

<table>
<thead>
<tr>

The Health and Economic Benefits of Raising New Hampshire’s Cigarette Tax

A $1.00 increase in New Hampshire’s cigarette tax would prevent approximately 6,300 youth from smoking and, over five years, save an estimated $2.43 million in lung cancer, heart attack, and stroke costs.

Raising the excise tax on cigarettes is one of the most effective ways to reduce smoking, save lives, and raise government revenue – even in tough economic times. Excise taxes decrease the number of youth who start smoking, increase the number of smokers who quit, cut health care costs, and reduce deaths from lung and other cancers, heart attacks, strokes, and other preventable diseases. The health benefits of cigarette taxes are even greater when the revenue raised is earmarked for tobacco control or public health programs.

New Hampshire’s current cigarette tax is $1.78 per pack, the 16th highest in the nation. This is near the nationwide average of $1.45 per pack. New Hampshire has not raised its cigarette tax since 2009.

**SAVING LIVES**

A $1.00-per-pack increase in New Hampshire’s cigarette tax would be expected to provide the following reductions in the number of smokers and, as a result, the number of smoking-related deaths:

Raising the excise tax on cigarettes is one of the most effective ways to reduce smoking, save lives, and raise government revenue – even in tough economic times. Excise taxes decrease the number of youth who start smoking, increase the number of smokers who quit, cut health care costs, and reduce deaths from lung and other cancers, heart attacks, strokes, and other preventable diseases. The health benefits of cigarette taxes are even greater when the revenue raised is earmarked for tobacco control or public health programs.

South Carolina’s current cigarette tax is $0.57 per pack, the 10th lowest in the nation. This is well below the nationwide average of $1.45 per pack. South Carolina has not raised its cigarette tax since 2010.

**SAVING LIVES**

A $1.00-per-pack increase in South Carolina’s cigarette tax would be expected to provide the following reductions in the number of smokers and, as a result, the number of smoking-related deaths:

<table>
<thead>
<tr>
<th>Adults Who Would Quit Smoking</th>
<th>Youth Who Would Never Start Smoking</th>
<th>Reduction in Smoking-Related Deaths</th>
</tr>
</thead>
<tbody>
<tr>
<td>25,700</td>
<td>28,400</td>
<td>23,000</td>
</tr>
</tbody>
</table>

**SAVING MONEY**

In addition to saving lives, raising South Carolina’s cigarette tax would cut healthcare costs and raise millions of dollars in revenue. Over time, a $1.00 cigarette tax increase would be expected to produce the following economic and fiscal benefits:

<table>
<thead>
<tr>
<th>Over Five Years</th>
<th>Over One Year</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lung Cancer Treatment Savings</td>
<td>$3.65M</td>
</tr>
<tr>
<td>Heart Attack and Stroke Treatment Savings</td>

</tr>
<tr>
<td>State’s Medicaid Program Savings</td>
<td>$1.47M</td>
</tr>
<tr>
<td>Smoking-Related Pregnancy Treatment Savings</td>
<td>$7.30M</td>
</tr>
<tr>
<td>Increase in State Revenue</td>
<td></td>
</tr>
</tbody>
</table>

The Health and Economic Benefits of Raising South Dakota’s Cigarette Tax

A $1.00 increase in South Dakota’s cigarette tax would prevent approximately 4,200 youth from smoking and, over five years, save an estimated $1.39 million in lung cancer, heart attack, and stroke costs.

Raising the excise tax on cigarettes is one of the most effective ways to reduce smoking, save lives, and raise government revenue – even in tough economic times. Excise taxes decrease the number of youth who start smoking, increase the number of smokers who quit, cut health care costs, and reduce deaths from lung and other cancers, heart attacks, strokes, and other preventable diseases. The health benefits of cigarette taxes are even greater when the revenue raised is earmarked for tobacco control or public health programs.

South Dakota’s current cigarette tax is $1.53 per pack, the 23rd highest in the nation. This is near the nationwide average of $1.45 per pack. South Dakota has not raised its cigarette tax since 2007.*

**SAVING LIVES**

A $1.00-per-pack increase in South Dakota’s cigarette tax would be expected to provide the following reductions in the number of smokers and, as a result, the number of smoking-related deaths:*  

<table>
<thead>
<tr>
<th>Adults Who Would Quit Smoking</th>
<th>Youth Who Would Never Start Smoking</th>
<th>Reduction in Smoking-Related Deaths</th>

*Estimates are based on analysis performed on behalf of the American Cancer Society Cancer Action Network. Totals in charts have been rounded.
Methodology

**KEY ASSUMPTIONS**

- The net-of-tax cigarette price is assumed to be rising at the same rate as it increased between November 2009 and November 2010.
- A 10 percent increase in cigarette price would reduce smoking prevalence among youth by 6.5 percent and overall consumption by 4 percent.
- All federal and state cigarette excise taxes are assumed to increase cigarette prices by the amount of the tax.
- The average probability of a premature death for a regular adult smoker falls from 0.50 to 0.10 after cessation.
- Smoking attributable death is based on a 0.50 probability.
- A 10 percent increase in cigarette prices would reduce smoking prevalence among pregnant women by 7 percent.
- All numbers are rounded. Totals do not always equal the summation of the rounded parts.

**DATA SOURCES**

**Tax Revenue**

All estimates are based on the state fiscal year, with the state tax increases assumed to go into effect at the start of the 2012 fiscal year (July 1, 2011). Data used for these estimates come from several sources:

Annual, state-level tax-paid cigarette sales are taken from *The Tax Burden on Tobacco, 2010*, and the monthly state cigarette sales and tax revenue reports published by Orzechowski and Walker. At the time these estimates were produced, the annual tax-paid sales data were available through FY2010 and the monthly data were available through October 2010.

State cigarette excise tax rates and effective dates for changes over the past several years were obtained from multiple sources, including: *The Tax Burden on Tobacco, 2010* (Orzechowski and Walker, 2011); and factsheets on state tax rates and increases from the Campaign for Tobacco-Free Kids (available on-line at: http://www.tobaccofreekids.org/research/factsheets/pdf/0275.pdf).

Average state-level retail cigarette prices, including generic brands, reported in *The Tax Burden on Tobacco, 2010* (Orzechowski and Walker, 2011).

**Smoking Prevalence**

Sources above, and these sources:

Adult Smoking Prevalence – data on state level smoking prevalence among persons 18 years of age and older in 2008 and 2009 are taken from the Centers for Disease Control and Prevention’s Behavioral Risk Factor Surveillance System (available on-line at www.cdc.gov/brfss).

Age-specific state-level population projections for each year were obtained from the U.S. Census Bureau (www.census.gov).
**Pregnant Women Smoking Prevalence**

In addition to the data on state cigarette taxes, cigarette prices, and the consumer price index described above:

State-specific smoking prevalence rates among pregnant women are taken from the Centers for Disease Control and Prevention Natality public-use data on CDC WONDER On-line Database. In reporting year 2006, maternal tobacco use for all the states that we are examining is provided, with the exception of California, Delaware, Florida, Idaho, Kansas, Kentucky, Nebraska, New Hampshire, New York, North Dakota, Ohio, Pennsylvania, South Carolina, Tennessee, Texas, Vermont, Washington, and Wyoming. Between 2002 and 2006, these states changed the way they collect smoking information among pregnant women. The new data is not comparable to the old data. Therefore, smoking prevalence rates among pregnant women using the latest year in which the old data collection is employed are used for these states.

California-specific smoking prevalence among pregnant women for 2003 was obtained from California Department of Health Services, Tobacco Control Section. Prevalence data for 2003 was obtained from: http://ww2.cdph.ca.gov/programs/tobacco/Documents/CTCPPregnancy06.pdf

State-level birth projections for 2012-2021 were obtained from the U.S. Census Bureau (http://www.census.gov/population/projections/DownldFile3.xls).

**Lung Cancer Incidence and Cost**

In addition to the data on state cigarette taxes, cigarette prices, and the consumer price index described above:

Total lung cancer deaths and smoking attributable lung cancer percent were obtained from the American Lung Association, “Trends in Lung Cancer Morbidity and Mortality,” Epidemiology and Statistical Unit, Research and Scientific Affairs, September 2008.

The prevalence of histologic types of lung cancer were obtained from the Wellness Community National Cancer Support Web site (http://www.thewellnesscommunity.com/programs/frankly/lung/lung_cancer_home.asp).

Data on state level smoking prevalence among persons 18 years of age and older in 2009 are taken from the Centers for Disease Control and Prevention's Behavioral Risk Factor Surveillance System (available on-line at www.cdc.gov/brfss).

**Heart Attack and Stroke Savings**

Smoking prevalence among individuals aged 35-64 in 2009 is based on the state specific population weighted averages of smoking prevalence rates for 35- to 44-year-olds, 45- to 54-year-olds, and 55- to 64-year-olds in 2009, taken from the Centers for Disease Control and Prevention's Behavioral Risk Factor Surveillance System (available on-line at www.cdc.gov/brfss).
**State Medicaid Savings**

In addition to the data on state cigarette taxes, cigarette prices, and the consumer price index described above:

The state-specific numbers of Adult Medicaid recipients in FY2007 were obtained from the Kaiser Family Foundation State Health Facts Web site: (http://www.statehealthfacts.org/medicaid.jsp).

The state-specific average expenditures per adult Medicaid recipients in FY2007 were obtained from the Kaiser Family Foundation State Health Facts Web site: (http://www.statehealthfacts.org/medicaid.jsp)

Federal Medical Assistance Percentages (FMAP) for Medicaid in FY2011 were obtained from the Kaiser Family Foundation State Health Facts Web site: http://www.statehealthfacts.org/comparetable.jsp?ind=184&cat=4

Smoking-attributable fractions (SAFs) for publicly funded health care for the 50 states and DC for fiscal year 1993 were obtained from Miller, L.S, et al. (1998) "State Estimates of Medicaid Expenditures Attributable to Cigarette Smoking Fiscal Year 1993" Public Health Reports 113:140-151.

State-specific prevalence of smoking among individuals with income levels less than $15,000 obtained from the Behavioral Risk Factor Surveillance System, 2009.\(^\text{12}\)

\(^\text{12}\) The BRFSS smoking prevalence rates for the states of Alaska, Nevada, and Wisconsin for individuals with incomes ≤$15,000 were not provided in 2009. Instead, the most recent prevalence figures for individuals with incomes ≤$15,000 were used for these states. In particular, for the states of Alaska, Nevada, and Wisconsin, the smoking prevalence rates for individuals with incomes ≤$15,000) from 2005, 2007, and 2008 were used respectively. These earlier prevalence rates were used to predict the 2009 prevalence rate of smoking among individuals with incomes ≤$15,000 accounting for the impact of state-specific changes in cigarette prices between 2005 and 2009 for Alaska, between 2007 and 2009 for Nevada, between 2008 and 2009 for Wisconsin and accounting for an annual natural decline of smoking prevalence of two percent.
